## Instructions

- Use **black** ink or ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided there may be more space than you need.
- Show all the steps in any calculations and state the units.

# Information

- The total mark for this paper is 110.
- The marks for each question are shown in brackets
   use this as a guide as to how much time to spend on each question.

# Advice

- Read each question carefully before you start to answer it.
- Write your answers neatly and in good English.
- Try to answer every question.
- Check your answers if you have time at the end.

The relative atomic masses of copper and chlorine have not been rounded to the nearest whole number.

\* The lanthanoids (atomic numbers 58–71) and the actinoids (atomic numbers 90–103) have been omitted.

The Periodic Table of the Elements

**BLANK PAGE** 

# Answer ALL questions.

# Some questions must be answered with a cross in a box ⊠. If you change your mind about an answer, put a line through the box ⊠ and then mark your new answer with a cross ⊠.

- **1** This question is about atomic structure.
  - (a) The table shows the number of protons, neutrons and electrons in five species, V, W, X, Y and Z.

The letters represent the species but are **not** symbols from the Periodic Table.

| Species | Number of protons | Number of neutrons | Number of electrons |
|---------|-------------------|--------------------|---------------------|
| V       | 29                | 38                 | 27                  |
| W       | 12                | 12                 | 12                  |
| Х       | 9                 | 10                 | 10                  |
| Y       | 6                 | б                  | 8                   |
| Z       | 7                 | 7                  | 10                  |

Choose letters from the table to answer these questions.

Each letter may be used once, more than once or not at all.

(i) Which species is an atom?

(1)

- (ii) Which species is an ion with a positive charge?
- (iii) Which species is an ion with a 3- charge?

(1)

| 2 | This question is about methane, CH₄                                       |       |
|---|---|-------|
|   | The diagram shows a Bunsen burner that uses methane.                      |       |
|   |   |       |
|   | (a) During combustion, methane reacts with a gas in the air.              |       |
|   | Give the name of this gas.  | (1)   |
|   | (b) Give the two products of the complete combustion of methane.          | (2)   |
|   | (c) During the incomplete combustion of methane, carbon monoxide forms.   |       |
|   | (i) Give a reason why carbon monoxide forms during incomplete combustion. | (1)   |
|   | (ii) State why carbon monoxide is poisonous.                              | (1)   |
|   | (d) The equation shows the reaction of methane with bromine.              |       |
|   | $CH_4 + Br_2 \rightarrow CH_3Br + HBr$                                    |       |
|   | Give the name of this type of chemical reaction.                          | (1)   |
|   | (Total for Question 2 = 6 m   | arks) |

This question is about the alkali metals. 4 A teacher demonstrates the reaction between sodium and water. The teacher fills a trough with water and then adds a piece of sodium. sodium (a) The sodium reacts with the water, forming bubbles of hydrogen gas and a colourless solution. State two other observations that would be made. (2) 1\_\_\_\_\_ 2 (b) Give a test to show that, at the end of the reaction, the solution contains sodium ions. (2) 10

P 7 3 4 2 4 A 0 1 0 3 2

- (c) Lithium, sodium and potassium react in a similar way when added to water.
  - (i) State, with reference to the electronic configurations of atoms, why these elements have similar reactions.

(ii) The table shows the atomic radius of a lithium atom, a sodium atom and a potassium atom.

| Atom      | Atomic radius in cm    |
|-----------|------------------------|
| lithium   | $1.82 \times 10^{-12}$ |
| sodium    | $2.27 \times 10^{-12}$ |
| potassium | $2.80 \times 10^{-12}$ |

Deduce the relationship between the atomic radius and the reactivity of the metals.

## (Total for Question 4 = 6 marks)

(b) Diagram 2 shows a chromatogram produced from four different food colourings, W, X, Y and Z.

### Diagram 2

- (i) Which two food colourings contain the same dye?
  - A W and X
    - **B** W and Y
    - C X and Z
    - D Y and Z
- (ii) Calculate the  $R_{\!f}$  value of the dye in food colouring W.

**12** This question is about the metal tantalum, Ta.

Tantalum metal can be produced by heating tantalum chloride (TaCl<sub>5</sub>) and hydrogen gas in a furnace.

The other product of the reaction is hydrogen chloride.

(a) Complete the equation for the reaction.

$$TaCl_{s}(s) + \dots + H_{2}(g) \rightarrow \dots + Ta(s) + \dots + HCl(g)$$

(b) As tantalum chloride is heated, the mass of solid in the furnace decreases leaving tantalum as the only solid product.

The table shows the mass of solid in the furnace at one-hour intervals.

| Time<br>in hours | Mass of solid in the furnace<br>in kg |
|------------------|---------------------------------------|
| 0                | 2510                                  |
| 1                | 2207                                  |

- (i) State how the data in the table shows that the reaction is complete.
- (1)

- (ii) Use the data to show that the formula of tantalum chloride is  $TaCl_5$ 
  - [for tantalum,  $A_r = 181$  for chlorine,  $A_r = 35.5$ ]
